CLASSIFIED BY: N/A
DECLASSIFY ON: N/A

Document Title: NAVSTAR GPS Space Segment / User Segment L5 Interface

RFC Title: 2018 Proposed Changes to the Public Documents

# Reason For Change (Driver):

The following topic was deferred from the 2017 Public ICWG and will now be resolved by this RFC.

Currently the Operational Advisories (OAs) that are published and archived contain plane/slot descriptions that
are not in the constellation definition provided to the public in the Standard Positioning Service (SPS)
Performance Standard (PS). The OA does not have the capability to correctly publish information regarding
fore/aft position since moving to the 24+3 constellation with three expanded slots. In addition, the Points of
Contact of the OA are not represented in a way that allows for efficient updates. This is a follow-up to RFC-351,
which was CCB-approved on 8-Jan-2018.

The following topic resolves 3 document clean-up related activities:

2. a) Signal-in-space topics need clarification, as identified by the public in past Public ICWGs. b) There were some administrative errors found during the UpRev process of the public documents. c) Contractor signatories are required for government-controlled documents.

(Pre-RFCs 819, 861)

# **Description of Change:**

1. Modify the OA as agreed to in ICD-GPS-240 and ICD-GPS-870.

 a) Provide clarity for the list of signal-in-space topics identified by the public.
 b) Clean up identified administrative changes in all public documents.
 c) Remove required contractor signatories from governmentcontrolled documents.

#### WAS:

Two PRN ranging codes are transmitted on L5: the in-phase code (denoted as the I5-code); and the quadraphase code (denoted as the Q5-code). Code-division-multiple-access techniques allow differentiating between the SVs even though they may transmit at the same L5 frequency. The SVs shall transmit intentionally "incorrect" versions of the I5 and the Q5-codes when needed to protect the users from receiving and utilizing anomalous NAV signals. These two "incorrect" codes are termed non-standard I5 (NSI5) and non-standard Q5 (NSQ5) codes.

# Redlines:

# WAS:

The L5 consists of two carrier components that are in phase quadrature with each other. Each carrier component is biphase shift key (BPSK) modulated by a separate bit train. One bit train is the modulo-2 sum of the I5-code, NAV data, and synchronization sequence while the other is the Q5-code with no NAV data, but with another synchronization sequence. For a particular SV, all transmitted signal elements (carriers, codes, synchronization sequences, and data) are coherently derived from the same on-board frequency source.

# WAS:

Equipment group delay is defined as the delay between the signal radiated output of a specific SV (measured at the antenna phase center) and the output of that SV's on-board frequency source; the delay consists of a bias term and an uncertainty. The bias term on L1/L2 P(Y) is of no concern to users since it is included in the clock correction parameters relayed in the NAV data, and is therefore accounted for by user computations of system time (reference paragraphs 20.3.3.2.3, 20.3.3.3.2.3 and 20.3.3.3.2.4). The uncertainty (variation) of these delays as well as the group delay differential between the signals of L1, L2, and L5 are defined in the following.

# **Section Number:**

3.3.1.7.2.0-1

# WAS:

The group delay differential between the radiated L1 and L5 signals (i.e. L1 P(Y) and L5 I5; and L1 P(Y) and L5 Q5) is specified as consisting of random plus bias components. The mean differential is defined as the bias component and will be either positive or negative. For a given navigation payload redundancy configuration, the absolute value of the mean differential delay shall not exceed 30.0 nanoseconds. The random plus non-random variations about the mean shall not exceed 3.0 nanoseconds (95% probability), when including consideration of the temperature and antenna effects during a vehicle orbital revolution. L1 and L2 group delay differential is described in 3.3.1.7.2 of IS-GPS-200. Corrections for the bias components of the group delay differential are provided to the users in the NAV message using parameters designated as T<sub>GD</sub> (reference paragraph 20.3.3.3.3.2 of IS-GPS-200) and Inter-Signal Correction (ISC) (reference paragraph 20.3.3.3.1.2).

# WAS:

The characteristics of the I5-codes and the Q5-codes are defined below in terms of their structure and the basic method used for generating them. Figures 3-2 and 3-3 depict simplified block diagrams of the scheme for generating the 10.23 Mbps  $I_{5i}(t)$  and  $Q_{5i}(t)$  patterns, and for modulo-2 summing the I5 patterns with the NAV bit train,  $D_{5}(t)$ , which is rate 1/2 encoded and clocked at 100 sps. In addition, the 100 sps are modulated with a 10-bit Neuman-Hofman code that is clocked at 1 kHz. The resultant composite bit trains are then used to modulate the L5 in-phase carrier. The Q5-code is modulated with a 20-bit Neuman-Hofman code that is also clocked at 1 kHz.

# WAS:

Before any new signal or group of signals (e.g., L2C, L5, M, L1C, etcetera) is declared operational, the availability of and/or the configuration of the broadcast signal or group of signals may not comply with all requirements of the relevant IS or ICD. For example, the pre-operational broadcast of L2C signals from the IIR-M satellites did not include any NAV or CNAV data as required by IS-GPS-200. Pre-operational use of any new signal or group of signals is at the users own risk.

#### Redlines:

# IS705-265:

#### **Section Number:**

20.3.3.2.4.0-6

# WAS:

For each URA<sub>NEDO</sub> index (N), users may compute a nominal URA<sub>NEDO</sub> value (X) as given by:

- If the value of N is 6 or less, but more than -16,  $X = 2^{(1+N/2)}$ ,
- If the value of N is 6 or more, but less than 15,  $X = 2^{(N-2)}$ ,
- N = -16 or N = 15 shall indicate the absence of an accuracy prediction and shall advise the standard positioning service user to use that SV at his own risk.

For N = 1, 3, and 5, X should be rounded to 2.8, 5.7, and 11.3 meters, respectively.

The nominal URA<sub>NEDO</sub> value (X) shall be suitable for use as a conservative prediction of the RMS NED range errors for accuracy-related purposes in the pseudorange domain (e.g., measurement de-weighting RAIM, FOM computations). Integrity properties of the IAURA<sub>NED</sub> are specified with respect to the scaled (multiplied by either 4.42 or 5.73 as appropriate) upper bound values of the URA<sub>NEDO</sub> index, URA<sub>NEDO</sub> index, and URA<sub>NEDO</sub> index (see 20.3.3.1.1).

URA<sub>NEDO</sub> accounts for zeroth order SIS-contributions to user range error which include, but are not limited to, the following: LSB representation/truncation error; the net effect of clock correction polynomial error and code phase error in the transmitted signal for single-frequency L1/L2/L5 users who correct the code phase as described in Section 20.3.3.3.1.1.1; the net effect of clock parameter, code phase, and inter-signal correction error for dual-frequency L1/L2 and L1/L5 users who correct for group delay and ionospheric effects as described in Section 20.3.3.3.1.2; radial ephemeris error; anisotropic antenna errors; and signal deformation error. URA<sub>NED</sub> does not account for user range contributions due to the inaccuracy of the broadcast ionospheric data parameters used in the single-frequency ionospheric model or for other atmospheric effects.

The transmitted  $URA_{NED1}$  index is an integer value in the range 0 to 7. The  $URA_{NED1}$  index has the following relationship to the  $URA_{NED1}$  value:

$$URA_{NED1} = \frac{1}{2^{N}}$$
 (meters/second)

where

N = 
$$14 + URA_{NED1}$$
 Index.

The transmitted  $URA_{NED2}$  index is an integer value in the range 0 to 7.  $URA_{NED2}$  index has the following relationship to the  $URA_{NED2}$ :

$$URA_{NED2} = \frac{1}{2^{N}}$$
 (meters/second/second)

where

N = 
$$28 + URA_{NED2}$$
 Index.

# Redlines:

The nominal URA<sub>NEDO</sub> value (X) shall be suitable for use as a conservative prediction of the RMS NED range errors for accuracy-related purposes in the pseudorange domain (e.g., measurement de-weighting RAIM, FOM computations). Integrity properties of the IAURA<sub>NED</sub> are specified with respect to the scaled (multiplied by either 4.42 or 5.73 as appropriate) upper bound values of the URA<sub>NEDO</sub> index, URA<sub>NEDO</sub> index, and URA<sub>NEDO</sub> index (see 20.3.3.1.1).

URA<sub>NEDO</sub> accounts for zeroth order SIS-contributions to user range error which include, but are not limited to, the following: LSB representation/truncation error; the net effect of clock correction polynomial error and code phase error in the transmitted signal for single-frequency L5 users who correct the code phase as described in Section 20.3.3.3.1.1.1; the net effect of clock parameter, code phase, and inter-signal correction error for dual-frequency L1 C/A/L5 and L2C/L5 users who correct for group delay and ionospheric effects as described in Section 20.3.3.3.1.2; radial ephemeris error; anisotropic antenna errors; and signal deformation error. URA<sub>NED</sub> does not account for user range contributions due to the inaccuracy of the broadcast ionospheric data parameters used in the single-frequency ionospheric model or for other atmospheric effects.

The transmitted  $URA_{NED1}$  index is an integer value in the range 0 to 7. The  $URA_{NED1}$  index has the following relationship to the  $URA_{NED1}$  value:

$$URA_{NED1} = \frac{1}{2^{N}}$$
 (meters/second)

where

N = 
$$14 + URA_{NED1}$$
 Index.

The transmitted  $URA_{NED2}$  index is an integer value in the range 0 to 7.  $URA_{NED2}$  index has the following relationship to the  $URA_{NED2}$ :

$$URA_{NED2} = \frac{1}{2^{N}}$$
 (meters/second/second)

where

N = 
$$28 + URA_{NED2}$$
 Index.

The ionospheric parameters which allow the "L5 only" user to utilize the ionospheric model for computation of the ionospheric delay are contained in message type 30. The "one frequency" user should use the model given in Figure 20-4 of IS-GPS-200 to make this correction. The calculated value of  $T_{iono}$  ( $T_{iono}$  = ionospheric correction parameter) in the model is referred to the L1 frequency; if the user is operating on the L5 frequency, the correction term must be multiplied by  $\gamma$ 15 (reference paragraph 20.3.3.3.1.2.2). It is estimated that the use of this model will provide at least a 50 percent reduction in the single-frequency user's RMS error due to ionospheric propagation effects. The bit lengths, scale factors, ranges, and units of these parameters are given in Table 20-X of IS-GPS-200 (See Figure 20-3 for complete ionospheric bit allocation).
